# Overarching Grand Challenge: Cognitive Support

PATIENT CARE

RESEARCH

Where  
clinicians  
want to stay

Virtual  
Patient

Medical  
Knowledge

Where Health IT  
chains us

Transactions

Raw data

Decision Support

Medical Logic

Clinical  
research  
transactions

Raw research  
data

Workflow modeling and support, usability, cognitive support, computer-supported cooperative work (CSCW), etc.

# Mismatch between Computational Technique & Scale of Problem

Automation

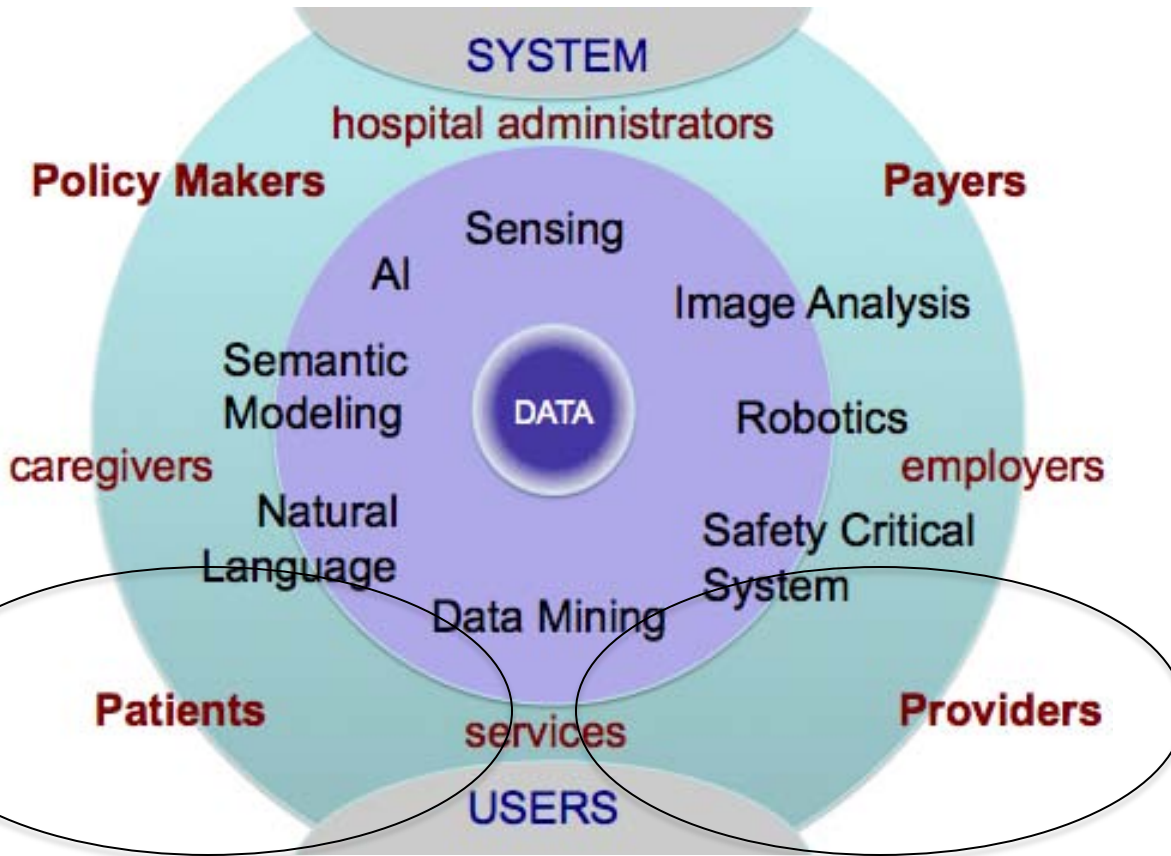

Connectivity

Decision  
Support

Data Mining

# How would you create a tool that would....

*Personalized medicine*

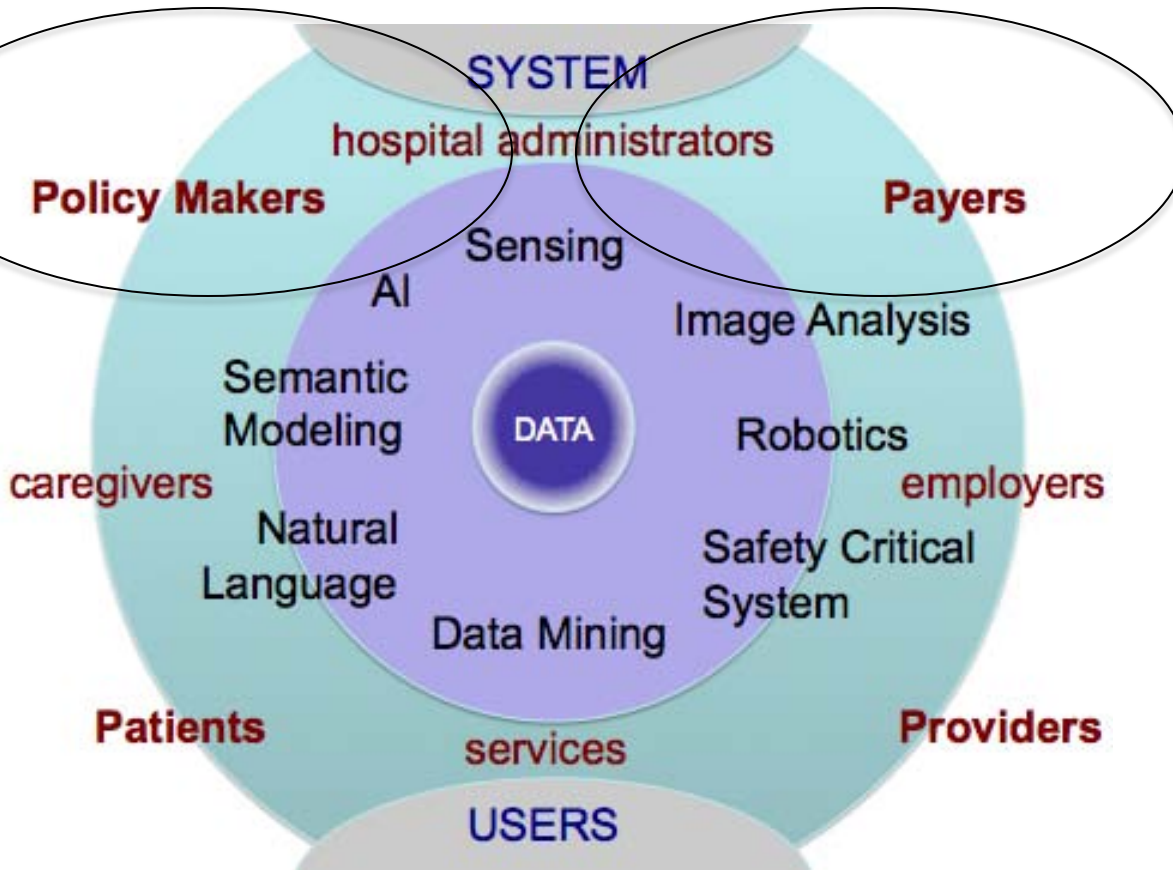

Detect indicators for autism from video records.

Create models of surprise for physicians

Support collaboration across a distributed care team

Provide personalized health coaches

# How would you create a tool that would....

*Drive before buying*

Optimize resources across the system

Align incentives to pay-for-outcome vs. pay-for-fee

Understand health disparity and utilization data

Predict overall economic losses due to poor healthcare

# Why now?

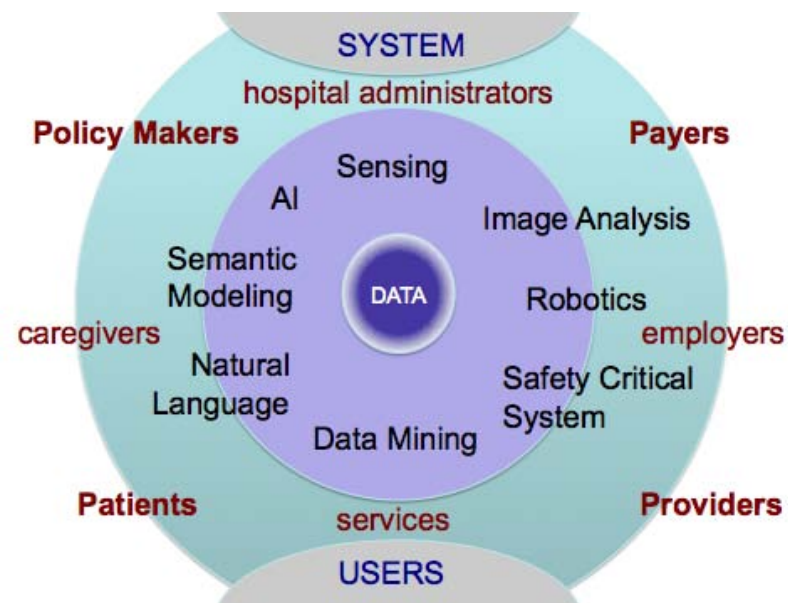

Major national investment in basic Health IT, e.g. EMRs and HIEs

New avenues for funding

US at or near bottom for managing chronic and population health care needs despite massive spending

Exponential growth in chronic diseases, esp associated with nutrition

Save \$80B / yr through improving care of 7 most common chronic diseases

*Transforming Healthcare*
